

## Nanoscale Materials and Their Properties Objectives, Essential Understandings, and Standards Addressed

This module builds upon the big ideas in a general chemistry course. Assessing students on those topics is necessary scaffolding in order to assess them for understanding nanoscience topics.

**Table 3: Big Ideas and Essential Understandings**

<b>Big Idea/Essential Understanding</b>
<p><b>EU1: Measurement and Size</b> Nanoscience is the study of the fundamental principles of molecules and structures having at least one dimension lying roughly between 1 and 100 nanometers.</p>
<p><b>EU2: Interdisciplinary Nature</b> Nanoscience includes the scientific concepts involved in biology, chemistry, and physics</p>
<p><b>EU3: Properties of Matter</b> Objects have physical and chemical properties. At the nanoscale level, a large fraction of an object's atoms, ions, or molecules are exposed at its surface; therefore, the object's physical and chemical properties are dominated by surface interactions.</p>
<p><b>EU4: Scientific Instruments</b> Scientific instruments can be used to characterize properties of objects, their structure and surfaces, even if the objects cannot be seen.</p>
<p><b>EU5: Applications/ Public Policy</b> A sound understanding of nanoscience is required to develop applications of nanotechnology and to inform public policy</p>

**Table 4: Module Objectives and Alignment to Standards**

NSES Content Standards Addressed	Big Idea/Essential Understanding	Lesson 1/ Objective
<p><b>Physical Science</b>  <b>Structure of Atoms</b>            Matter is made of minute particles called atoms, and atoms are composed of even smaller components. These components have measurable properties, such as mass and electrical charge.</p>	<p><b>EU1: Measurement and Size</b>            Nanoscience is the study of the fundamental principles of molecules and structures having at least one dimension lying roughly between 1 and 100 nanometers.</p>	<p>1. Define nanoscience as the study of the fundamental principles of structures having at least one dimension lying roughly between 1 and 100 nanometers.</p> <p>a) Compare and contrast the size of atoms, ions, and molecules to the size of nanoparticles.</p> <p>b) Identify structures that are appropriately measured in nanometers.</p> <p>c) Compare and contrast nanoparticle samples to atomic and macro-level samples in terms of the particle size, number of atoms, and operational model.</p>
<p><b>Science in Personal and Social Perspectives</b>            Science and Technology in Local, National, and Global Challenges</p> <p>Individuals and society must decide on proposals involving new research and the introduction of new technologies into society.</p>	<p><b>EU5: Applications/ Public Policy</b>            A sound understanding of nanoscience is required to develop applications of nanotechnology and to inform public policy.</p>	<p>2. Explain the importance of nanoscience research and technology.</p> <p>3. Evaluate the ethical considerations associated with nanoscience research and nanotechnology.</p>
<p><b>Science and Technology Understandings about Science and Technology</b>            Scientists in different disciplines ask different questions, and use different methods of investigation.</p>	<p><b>EU2: Interdisciplinary Nature</b>            Nanoscience includes the scientific concepts involved in biology, chemistry, and physics.</p>	<p>4. Recognize the interdisciplinary nature of nanoscience.</p>
<p><b>Science as Inquiry Understandings about Scientific Inquiry</b>            Scientists rely on technology to enhance the gathering and manipulation of data.</p>	<p><b>EU4: Scientific Instruments</b>            Scientific instruments can be used to characterize properties of objects, their structure, and surfaces, even if the objects cannot be seen.</p>	<p>5. Identify the requirements of nanoscience and nanotechnology, including:</p> <p>a) new production methods,</p> <p>b) new measurement instruments, and</p> <p>c) a cleanroom environment for nanoscale research and technology.</p>

NSES Content Standards Addressed	Big Idea/Essential Understanding	Lesson 2/ Objective
<p><b>Physical Science</b>  <b>Structure of Atoms</b>            Matter is made of minute particles called atoms, and atoms are composed of even smaller components.</p> <p>These components have measurable properties, such as mass and electrical charge.</p>	<p><b>EU3: Properties of Matter</b>            At the nanoscale level, a large fraction of an object's atoms, ions, or molecules are exposed at its surface; therefore, the object's physical and chemical properties are dominated by surface interactions.</p>	<p>6. Define extendable solids.</p> <p>a) Identify elements and compounds that form extendable structures.</p> <p>b) Compare and contrast extendable solids.</p>
<p><b>Physical Science</b>  <b>Structure and Properties of Matter</b></p> <p>Atoms interact with one another by transferring or sharing electrons that are furthest from the nucleus. These outer electrons govern the chemical properties of the element.</p> <p>Bonds between atoms are created when electrons are paired up by being transferred or shared. A substance composed of a single kind of atom is called an element.</p> <p>The atoms may be bonded together into molecules or crystalline solids. A compound is formed when two or more kinds of atoms bind together chemically.</p>	<p><b>EU3: Properties of Matter</b>            At the nanoscale level, a large fraction of an object's atoms, ions, or molecules are exposed at its surface; therefore, the object's physical and chemical properties are dominated by surface interactions.</p>	<p>7. Recognize that an extendable nanostructure's physical and chemical properties are dominated by surface interactions.</p> <p>a) Relate the size and properties of a sample (both macro-samples and nano-samples) to the ratio of surface particles to interior particles in the sample.</p> <p>b) Define surface energy.</p> <p>c) Compare and contrast the physical and chemical properties of metallic elements and ionic compounds at both the macro and nano scale (i.e., melting point, electrical conductivity, color, reactivity, catalysis, adsorption).</p>
<p><b>Science in Personal and Social Perspectives</b>  <b>Science and Technology in Local, National, and Global Challenges</b></p> <p>Individuals and society must decide on proposals involving new research and the introduction of new technologies into society.</p>	<p><b>EU5: Applications/ Public Policy</b>            A sound understanding of nanoscience is required to develop applications of nanotechnology and to inform public policy</p>	<p>8. Evaluate the implications of nanoscale research and technology.</p>

NSES Content Standards Addressed	Big Idea/Essential Understanding	Lesson 3/ Objective
<p><b>Physical Science Structure and Properties of Matter</b> The physical properties of compounds reflect the nature of the interactions among its molecules.</p> <p>These interactions are determined by the structure of the molecule, including the constituent atoms and the distances and angles between them.</p>	<p><b>EU3: Properties of Matter</b> At the nanoscale level, a large fraction of an object's atoms, ions, or molecules are exposed at its surface; therefore, the object's physical and chemical properties are dominated by surface interactions.</p>	<p>9. Identify elements that can form discrete nanoparticles.</p>
		<p>a) Recognize that discrete nanoparticles are a result of covalent bonding patterns.</p>
<p><b>Physical Science Structure and Properties of Matter</b> Carbon atoms can bond to one another in chains, rings, and branching networks to form a variety of structures, including synthetic polymers, oils, and the large molecules essential to life.</p>	<p><b>EU3: Properties of Matter</b> At the nanoscale level, a large fraction of an object's atoms, ions, or molecules are exposed at its surface; therefore, the object's physical and chemical properties are dominated by surface interactions.</p>	<p>10. Compare and contrast the properties of several allotropes of carbon (i.e., graphite, diamond, fullerenes).</p>
		<p>a) Analyze the covalent bonding patterns of carbon and the resulting three dimensional shapes of molecules and carbon allotropes.</p> <p>b) Relate the bonding and structure of carbon nanoparticles to their properties (i.e., corannulene, buckyballs, fullerenes, nanotubes).</p>
<p><b>Science in Personal and Social Perspectives</b> Science and Technology in Local, National, and Global Challenges</p> <p>Individuals and society must decide on proposals involving new research and the introduction of new technologies into society.</p>	<p><b>EU5: Applications/ Public Policy</b> A sound understanding of nanoscience is required to develop applications of nanotechnology and to inform public policy.</p>	<p>11. Explore the potential applications of carbon nanoparticles and nanotechnology.</p>
		<p>a) Define nanotechnology as the use of discrete nanoparticles to produce useful products and materials.</p>
		<p>b) Compare and contrast endohedral (cage) and exohedral fullerene compounds and their applications.</p> <p>c) Describe the properties and potential uses of carbon nanotubes.</p>
